

# SPRING THREAD®

## *Our Story*

In 2005, biomedical engineer, Dr Jean Frismand, investigated cosmetic threads.

He went to doctors and asked, “When you administer threads, what are you looking for?”

They said they wanted a long and strong thread, reliable and simple to use.

Doctors want a flexible thread, with elasticity, as they want to treat parts of the face which are moving a lot, and if they have a thread that’s rigid, they’ll have a rigid aspect.

Jean then went to the patients and asked, “What do you want from your thread treatment?” They said, “We want something effective that will last a long time; we don’t want to go back and pay for the thread treatment every six months.”

Jean then applied his 25 years' experience in designing surgical implants to create Spring Thread®.

The unique design and composition of Spring Thread® satisfies the demand of both patient and doctor.

Spring Thread® offers a new and long-lasting method to lift sagging skin and restore youthful definition to the face, with a very natural looking effect.

Jean founded 1st SurgiConcept® in France in 2007, to manufacture and distribute Spring Thread® throughout the globe.

1st SurgiConcept® products are 100% manufactured in France in accordance with the European standards for medical devices (Directive CE93-42 and ISO 13485 relating to Class I medical devices).

At the beginning of 2013, Dominique Malard, already manager of a biotech company, bought 1st SurgiConcept® and continues to develop the company with the support of Jean Frismand.

Today, Spring Thread® is available worldwide through a network of distributors and reference practitioners for which this innovative and minimally invasive technique can be an option for people not quite needing or wanting more aggressive treatments such as surgical face lifting.
